                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to the isolation of 9 novel human PRO CC polypeptides (AAU09178-AAU09186) and the cDNA sequences encoding them. CC The novel pro polypeptides include PRO1356, PRO1268, PRO1364, PRO3444, CC PRO3151, PRO4322, PRO9964, PRO10008 and PRO19598. The cDNA sequences CC encoding these PRO polypeptides have been designated as clones CDNA64866-1601, DNA64903-1553, DNA84318-2520, DNA84997, DNA89273, CC DNA92223-2567, DNA96973, DNAN101921 and DNA145887 respectively. CC compositions (e.g. vaccines) containing PRO polypeptides and methods of CC immune-related disorders. Such disorders include immune-mediated CC inflammatory disorders. Such disorders include immune-mediated CC inflammatory disorders (e.g. diabetes mellittus), non-immune-mediated CC (e.g. granulomatous hepatitis), immunodeficiency disorders (e.g. AIDS), CC autoimmune disorders (e.g. rheumatoid arthritis), immune-related renal CC diseases (e.g. cirrhosis), demyelinating diseases of the peripheral or CC central nervous system (e.g. Guillain-Barre syndrome), immune-mediated CC in diseases (e.g. corrhosis), demyelinating diseases of the peripheral or CC central nervous system (e.g. Guillain-Barre syndrome), immune-mediated CC in diseases (e.g. corrhosis), demyelinating diseases of the peripheral or CC central nervous system (e.g. Guillain-Barre syndrome), immune-mediated CC in diseases. The polynucleotide sequences of the invention may be used in gene therapy. AAS15360-AAS15368 represent cDNA sequences CC encoding for the novel human PRO polypeptides of the invention.

                                                                                       В
                                                                                                                                                                                                   The present invention relates to a new polynucleotide that encodes a CC soluble protein which binds to interleukin (IL)-TIF/IL-22 (also referred to as IL-22BP), where the complementary sequence of the invention CC hybridises under stringent conditions to a nucleotide sequence of 2271 or 2366 base pairs, as given in the specification. The molecules of the CC invention are useful for inhibiting (anatagonising) effect of IL-TIF/IL-22 on a cell, for determining whether IL-TIF/IL-22 is present in a sample, CC for inhibiting binding of IL-TIF/IL-22 to a binding partner, preferably in vitro, and for obtaining an antibody molecule specific for the soluble binding protein of the invention, from a population or panel of antibody molecules of diverse binding specificity. The soluble protein is further useful in manufacture of a medicament for treating an IL-22 mediated disease and for assaying an agent, preferably an antibody or a peptide fragment of IL-TIF/IL-22 or the soluble protein, that modulates binding CC used in the manufacture of medicament for treating IL-TIF/IL-22 mediated disorder. The antibody is useful for determining presence of the soluble protein, where the antibody is detectably labelled. The present nucleic acid sequence encodes the human IL-TIF/IL-22 binding protein #2 of the
                                                                                                              Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Polynucleotide and polypeptide of soluble protein which binds to interleukin-TIF/IL-22 useful for inhibiting effect of IL-TIF/IL-22 on

                                                                                                                                                               This invention relates to the cDNA and protein sequences of novel secreted and transmembrane polypeptides PNO polypeptides. The invention also comprises a method for producing the proteins of the invention by recombinant means and antibodies specific for the protein of the invention. The antibody may be used for detecting the PNO proteins of the invention and may be used to modify their activity. polynucleotides may be used as hybridisation probes for a cDNA library to isolate the full-length PRO cDNA or to isolate other cDNAs, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cDNA encoding human Pro peptide #57
                                                                     construct hybridisation probes for mapping the gene which encodes that PRO and for genetic analysis of individuals with genetic disorders, in assays to identify other proteins or molecules involved in binding reaction, to generate transgenic animals or knock-out animals which in turn are useful in the development and screening of therapeutically useful reagents, for chromosome identification, and tissue typing. The
                                                                                                                                                                                                                                                                                                      Claim
                                                                                                                                                                                                                                                                                                                                 New PRO polypeptides and polynucleotides encoding the polypeptides, useful in gene therapy, chromosome identification, tissue typing, or for genetic analysis of individuals with genetic disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     05-SEP-2000;

            PRO polypeptides are useful in gene therapy, and as molecular weight markers for protein electrophoresis purposes. The sequences may also be used to detect overexpression on PRO polypeptides in cancerous tumours and for screening for differentially expressed genes using

                                                                                  The present invention relates to a new polynucleotide that encodes a CC soluble protein which binds to interleukin (II)-TIF/II-22 (also referred CC to as II-22BP), where the complementary sequence of the invention are useful for inhibiting cantagonising) effect of 1271 CC hybridises under stringent conditions to a nucleotide sequence of 2271 CC invention are useful for inhibiting (antagonising) effect of II-TIF/II-22 con a cell, for determining whether II-TIF/II-22 is present in a sample CC in vitro, and for obtaining an antibody molecule specific for the soluble conditing protein of the invention, from a population or panel of antibody consecules of diverse binding specificity. The soluble protein is further CC useful in manufacture of a medicament for treating an II-22 mediated CC disorder. The manufacture of medicament for treating an invention of the soluble protein, that modulates binding conditions of the soluble protein for the soluble protein, that modulates binding content of II-TIF/II-22, where the agent identified is used in the manufacture of medicament for treating II-TIF/II-22 mediated content for the antibody is useful for determining presence of the soluble protein, where the antibody is detectably labelled. The present nucleic acid sequence encodes the human II-TIF/II-22 binding protein #1 of the

ZCYTO18 protein induces proliferation of cells expressing zcytor11, a receptor for ZCYTO18 or induces cytotoxicity in K5626 cells. ZCYTO18 DNA is useful for detecting a genetic abnormality in a patient. ZCYTO18 DNA and its antibodies are useful for detecting cancer and inflammation. ZCYTO18 protein is useful for killing cancer cells. It is useful for increasing platelets in a patient or injured tissue. It is also used in gene therapy. The present sequence is a cDNA encoding human zcytor16, which is a contract of the present sequence is a cDNA encoding human zcytor16, which is a contract of the present sequence is a cDNA encoding human zcytor16.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cytokine receptor; zcytor16; IL-TIF; antiinflammatory; antirheumatic; antiarthritic; antiasthmatic; antiatherc
         inflammatory response in a mammal with inflammation. Heteromeric/
multimeric receptor polypeptides such as soluble zcytor 16/CRF2-4 can be
used to reduce progression and symptoms of cancer. Zcytor16 polypeptides
can also be used to detect IL-TIF levels which is indicative of
pathological conditions including inflammatory states (e.g. rheumatoid
arthritis) and cancer. Antibodies that bind zcytor16 polypeptides and the
polypeptides themselves are useful for the treatment of inflammation,
                                                                                                                                        The invention relates to a human cytokine receptor polypeptide, designated zcytor16. The zcytor16 polypeptide can be expressed by standard recombinant methodology and can bind to IL-TIF (undefined). The zcytor16 protein is useful for: inhibiting IL-TIF induced proliferation or differentiation of hematopoietic cell(s) (progenitors); reducing IL-TIF induced or IL-9 induced inflammation; and suppressing an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  antirheumatic; antiarthritic; antiasthmatic; antiathe immunosuppressive; chromosome 6q24.1-25.2; human; ss.
